

SamuSignal Pro — Setup Guide

Everything you need: API keys, Telegram alerts, and how every feature works.

1. Quick Start — 5 minutes

You only need one thing to start: a **TwelveData API key**. Without it, no prices will load.

- 1 Opening the app starts your 7-day free trial automatically. The header shows how many days remain.
- 2 Tap **SETTINGS** and paste your API key into the **Market Data (TwelveData)** field (next section explains how to get one).
- 3 Tap **SAVE**. The header should now read "API connected".
- 4 On the Signals page, pick a pair and timeframe, then tap **ANALYZE**.

2. TwelveData API Key

This key fetches live prices and candles. The free plan gives **800 credits per day**, which is plenty for normal use.

- 1 Open **twelvedata.com** in your browser.
- 2 Tap **Sign Up** and create a free account with your email.
- 3 Verify your email using the link they send you.
- 4 Sign in and open the **Dashboard**. Find **API Keys** in the left menu.
- 5 A key is already created for you. Tap the copy icon next to it.
- 6 In the app, paste it into **SETTINGS > Market Data**, then tap **SAVE**.

How credits are spent: one Analyze costs 1–3 credits depending on timeframe. A scan costs 1 credit per pair. Chart tracking costs 1 credit per check. The daily cap defaults to 700 so you always keep a buffer.

Note: the free plan blocks metals such as XAUUSD and some exotic crosses. Those pairs will show as "locked". Major pairs like EURUSD, GBPUSD and USDJPY always work.

3. Google Gemini API Key (optional)

Gemini does two things: it explains a signal in plain language, and it **reads chart screenshots**. The rest of the app works fine without it — only those two features need it.

- 1 Open **aistudio.google.com** and sign in with a Google account.
- 2 Tap **Get API key** in the left menu.
- 3 Tap **Create API key**, creating a new project if asked.
- 4 Copy the key.
- 5 In the app, paste it into SETTINGS > AI Analysis (Gemini), then SAVE.
- 6 Tap **SHOW MODELS** to confirm the key is working.

4. Telegram Alerts (optional)

This sends every signal and trade close to your Telegram. You need two things: a **bot token** and a **chat ID**.

Bot token

- 1 Search for **@BotFather** in Telegram and open the chat.
- 2 Send **/newbot**.
- 3 Give it any name, then a username ending in **bot**, such as *samu_alerts_bot*.
- 4 BotFather replies with a long token. Copy it.

Chat ID

- 1 Open your new bot in Telegram and tap **Start**.
- 2 Send it any message, for example "hi".
- 3 Paste the token on the ALERTS page in the app, then tap **SEND TEST**.
- 4 If the message arrives, you are done. If not, message **@userinfobot** in Telegram to get your ID and paste that into the app.

You must tap Start on your own bot first. Telegram does not let a bot message you until you have spoken to it.

5. The Pages

Page	What it does
SIGNALS	Pick a pair and timeframe, tap Analyze. You get a direction, quality score, entry/SL/TP levels, a full written bre
SCAN	Runs the same engine across your whole watchlist and ranks what it finds. Costs 1 credit per pair. Results ex
VOTES	Shows how each of the 50 rule-based agents voted, and their live win rate. The Backtest tab replays them ov
MARKET	A live rate table across currency groups, metals, indices and crypto.
TRADES	Your journal. Log trades you took, track live P&L, edit SL/TP, and see your win rate and breakeven maths. In
ALERTS	Telegram setup, chart screenshot analysis, live tracking, and your backup tools.

6. Chart Screenshot Analysis

On the ALERTS page, upload a screenshot of your chart. Gemini reads it and returns a full analysis.

- Choose your **trading style** first — Scalping, Day or Swing. This changes how wide the stops and targets are.
- Use a clean screenshot where both the **price axis** and the **pair name** are visible.
- You get: BUY/SELL, entry, SL, TP1, TP2, a confidence score, trend, support and resistance, reasoning, the invalidation level, and the counter-trade case.
- Tap **TRACK THIS SETUP** and the app watches that pair, alerting you at the entry, stop and target levels.

*Important: the levels are **read from your screenshot**, not from live data. Always check them against the current price before acting. Tracking only runs while the app is open — a phone cannot wake a web app in the background.*

7. Risk and TP/SL Settings

There are two ways to size stops and targets:

- **Fixed dollar** — the same dollar amount on every pair. Simple, but the stop ends up far too tight on volatile instruments like gold.
- **ATR based** — the stop is sized to how much the market actually moves: wide on gold, tight on EURUSD. Turn on "Auto lot" with this and your risk stays fixed in dollars while the lot size adjusts itself.

TP and SL values are set **per 0.01 lot**. Raising the lot size scales the dollar amount automatically while the price distance stays the same.

Gold, US30 and BTC ship with their own defaults, because the global \$1/\$2.50 values make no sense on them. You can change these under Per-Pair Settings.

8. Trial, Licence and Restore

- Installing the app starts a **7-day free trial** automatically. The header counts down the days.
- When the trial ends the app locks, **but your data is kept** — trades and history are not deleted.
- After unlocking you receive a **restore code**. Keep it somewhere safe.
- New phone, or reinstalled the app? Enter the restore code on the lock screen and your licence comes back. It works on up to **3 devices**.
- Your restore code is always visible in the Licence sheet (tap the badge in the header).

9. Troubleshooting

Problem	Fix
"Set your API key"	The TwelveData key is missing or was not saved. Re-paste it and tap SAVE.
Pair shows "locked"	That instrument is not on your TwelveData plan. Use a major pair, or reset locked pairs in Settings
"Out of credits"	You used all 800 for the day. They reset at 00:00 UTC. Reduce your watchlist or slow the auto-refr
AI does not respond	Check the Gemini key with SHOW MODELS. If the quota is exhausted it resets the next day.
Telegram test fails	Open your bot and tap Start first. Then confirm the chat ID with @userinfobot.
Chart "unreadable"	Retake the screenshot so the price axis and pair name are both clearly visible.
Tracking stopped	Tracking only runs while the app is open. Reopen it and tap CHECK NOW.

10. Important Disclaimer

SamuSignal Pro is an analysis and journaling tool. It is not financial advice. The signals, scores, agent votes, backtests and AI commentary it produces are generated from technical indicators and are for informational purposes only. They are not a recommendation to buy or sell anything.

Trading foreign exchange, gold, indices and cryptocurrencies on margin carries a high level of risk and can result in the loss of more than your initial deposit. Past performance, including any backtest shown in this

app, does not predict future results. The app does not connect to any broker and cannot place real orders — every trade is your own decision and your own responsibility. If you are unsure, seek advice from a licensed financial professional.
